AB A process for the preparation of solid formulations of a lipid-regulating agent having enhanced dissoln. and absorption characteristics, in which a micronized mixture of the said lipid-regulating agent, and optionally one or more excipients, is suspended in a surfactant solution, dried and optionally granulated, and optionally converted to a finished dosage form. Milled fenofibrate:lactose (95:5) particles 12 g were added to sodium lauryl sulfate aqueous solution (1.29/250mL) with mixing. The resulting suspension was shaken well, sonicated, and made ready for spray drying.

AB In a simplification of a conventional process for manufacturing pharmaceutical preps. containing fenofibrate, a lipid-lowering drug, fenofibrate particles are mixed with particles of PVP, crosslinked PVP, and other excipients, the mixture is granulated with  $\geq 1.5$  weight% of an aqueous solution of  $\geq 1$  surfactant, and the granules are dried. This procedure does not require comminution of fenofibrate and surfactant, and provides a product with equal bioavailability to that of the prior art.
